Abstract

Overall, the International Day of Yoga (IDY) has received relatively little in the way of scholarly attention. What has been published tends to focus on promoting public diplomacy through health promotion and culturally relevant nation branding. What has received little critical attention is the longitudinal evolution of the event’s internal discourse structure. Therefore, this study presents an integrated computational discourse analysis of a multi-tiered text corpus comprising 1,758 policy and research artifacts. This is anchored by a longitudinal core of 509 English YouTube transcripts spanning 2014–2026. Analysis incorporated a variety of methods, including a custom Discourse Structure Index (DSI), hierarchical cluster analysis, ANOVA, interaction models, mixed-effects regression, and proximity co-occurrence mapping. This framework tracked how this ”yogic” civilizational discourse mutated into a framework for global environmental governance. As a result, there are four distinct discourse communities that emerge from the data. These demonstrate significant temporal variation, indicating an increasing differentiation among institutional actors and uneven developmental trajectories across clusters. What proximity mapping reveals is occurrence of strict stratification where localized, organic terms (*nature*, $n = 227$; *lifestyle*, $n = 220$) establish a baseline narrative. This narrative becomes structurally mapped onto formal institutional targets (*sdg*, $n = 36$; *climate*, $n = 24$). Ultimately, the findings demonstrate the discursive pathways that the IDY has developed along. This includes the heterogeneous, highly institutionalized, and mediatized discursive field that it generates, which functions as an elegant programmatic apologia. Converting personal spiritual constraints into state-level environmental frameworks like the Indian state’s Mission LiFE.

1 Introduction

In the contemporary geopolitical arena, soft power and public diplomacy have transitioned from peripheral exercises in nation branding to core instruments of global governance [1, 2]. As Udo Merkel mentions, in relation to public events, spectacles, and international festivals, understanding the discursive construction and presentation of identities is key.

Thus, under the administration of India’s Prime Minister Narendra Modi, the Indian state has worked to systematically leverage its civilizational – yogic – statecraft as a way to project South Asian philosophy onto multilateral platforms [3]. The quintessential manifestation of this strategy was the establishment of the United Nations’ International Day of Yoga (IDY) in late 2014.

Typically, IDY-focused scholarship evaluates the event through a public health promotion lens blurred by New Age sentiments of mindfulness. However, this scholarly trend tends to overlook adopting a more critical inspection of localized wellness statecraft [4]. Even less attention has been paid to the internal linguistic architecture of the event, which has undergone a rhetorical shift over its twelve-year trajectory.

This discursive evolution systematically re-frames yoga’s past, present, and future. The way it has done this is to construct a discursive field within which a very abstracted and semantically dense noun expands itself beyond being an individual wellness practice to become a macro-level mechanism for environmental sustainability, climate mitigation, and international resource action [5]. Instead of the message remaining static, the IDY has evolved into a highly complex, heterogeneous discursive field. This field has become shaped by overlapping processes of mediatization and institutionalization [6]. However, underutilized is any critical empirical evaluation of this linguistic shift. Instead, a great deal of the existing literature operates with an uncritical apologetic tone, accepting the premise that attaching ancient Sanskrit ethical tenets to modern industrial crises inherently yields sustainable outcomes [7].

When thinking about narratives, it is important to consider the networks that they bind. According to [8], a network can be understood as a diverse collection of characters, objects, and events (i.e, an emplotment). It is the narrative which supports the forming and functioning of the network as its underlying logic. Furthermore, storytelling is essential to generating action in the public realm, which is how IDY’s reliance on the mythology of yoga finds purchase in both nation branding and bureaucratic/governance processes and policies [9]. Regardless of empirical efficacy.

Discourse clusters are particular groups of words, phrases, metaphors, linguistic features or arguments used in natural speech. What the study of clusters reveals is how people organize ideas and express intent. Such clusters can differ significantly in terms of structural or semantic complexity. They can remain intact or degrade, adapt, split or fade through influence from other clusters. Thus, the unique temporal trajectories relate to how, and for how long, public attention might be sustained. Therefore, this approach is one way to better understand the public’s attention span toward IDY.

This study addresses this gap by presenting a longitudinal computational text analysis. What this involves is indexing a broad contextual corpus of 1,758 policy documents and research tracks. In turn, this is underwritten by a deeper, core dataset of 509 longitudinal English YouTube transcripts, which spans 2014–2026 [10]. As a result of tracking semantic structures through advanced statistical modeling, this paper reveals the hidden trajectories of the Indian state’s yogic inspired discourse, how institutional splits occur, and what thematic regularities characterize India’s premier soft power initiative.

It begins by asking the following questions:

1. Do discourse clusters differ significantly in discourse structure?

2. Does discourse structure change over time?
3. Do clusters exhibit different temporal trajectories?

2 Literature Review

2.1 International Day of Yoga Scholarship

Scholarly literature on IDY is relatively limited. It is typically dominated by studies emphasizing health promotion, participation, wellness outcomes, and institutional growth. Consequently, prevailing IDY literature primarily functions as a type of apologia. More generally, the overwhelming majority of peer reviewed studies on yoga focus on its applicability for biomedical interventions. This is why IDY enriched studies have focused on documenting participation in IDY events and evaluating the role of yoga within public health initiatives. Two early examples include conference reports associated with the first and second IDY celebrations at Kolar, India, which highlighted yoga’s role in health promotion and lifestyle management [11, 12]. Most of the academic interest in IDY is from India’s domestic scholars, with more recent studies having examined the broader social and institutional impact of IDY, including assessments of participant outcomes and analyses of the global growth of yoga-related research [13, 14, 15].

Despite this collective body of scholarship contributing valuable insights into the health, educational, and organizational dimensions of IDY, a lot of the literature approaches IDY with an apologetic tone. Treating it as a wellness initiative or public-health intervention, rather than as a complex communicative phenomenon operating across multiple institutional domains.

2.2 The Prevalence of Normative Scholarship

The current literature is explicitly normative in orientation, tending toward emphasizing the benefits of yoga for individual well-being, public health, social cohesion, sustainable living, or cosmic harmony. Typically, the perceived value and impact of yoga, as well as the assumed significance and impact of IDY, divests from investigating how such significance is constructed, communicated, and negotiated through analysis of discourse.

This results in relatively little attention being directed toward the communicative structures through which IDY acquires meaning across governmental, media, educational, wellness, and civil-society contexts. This represents a significant gap given the increasingly global and institutionally diverse character of the observance.

2.3 Critical Perspectives: Soft Power, Nationalism, and Public Culture

There is, however, a much smaller body of scholarship, which has focused more on critiquing IDY’s instrumentalization into soft power, cultural diplomacy, nationalism, and political symbolism. For example, Gautam and Droogan argue that yoga functions as a significant component of India’s soft-power strategy, enabling the projection of cultural influence through a globally recognizable practice [16]. Likewise, Miller shows how yoga’s discourse connects to wider narratives concerning climate change, self-care, and governance [17]. Similarly, Samal contextualizes IDY within India’s international soft-power ambitions [18].

Tensions surrounding nationalism, authenticity, and the political uses of yoga appear in fewer critical studies. For example, Lakshmi argues that IDY constitutes an important site for nationalism and public culture to be both performed and negotiated [19]. So too, McCartney’s work similarly examines the intersections of yoga, nationalism, cultural authenticity, neoliberalism, and soft power,

demonstrating how contemporary yoga movements frequently operate within broader political and ideological frameworks [20, 21, 22, 23, 24]. Combined, what these studies suggest is that IDY functions, not only as a public health initiative but, as a communicative arena within which multiple interpretations of culture, spirituality, citizenship, national identity, and global governance coexist and compete.

2.4 Mediatization and Institutionalization

Drawing upon theoretical perspectives concerning mediatization and institutionalization leads to understanding how social and cultural processes are susceptible to being shaped by media logics and communicative infrastructures, producing new forms of visibility, coordination, and social organization [6]. Yoga and gurus, especially, are not immune to such logics and processes [25, 26]. The idea of the guru is especially pertinent here. For example, Copeman and Ikegame [25] mention the political and governmental functionality of "guru governmentality" as a radically asymmetric version of the guru-devotee relationship that is retooled toward "humanitarian," "sustainability" and "developmental" agendas. This abstraction is clarified through the "business ascetic" branding of Prime Minister Narendra Modi. Modi is repackaged as a sovereign guru of an ascetic variety, who institutionalizes and mobilizes the political power of this ascetic mode, forging India's position as a global spiritual authority [27]. This ambition is tied to repeated assertions that India is the "world teacher" (i.e., *viśva-guru*) who might have the capacity to morally correct the world through projecting India to the top of the geopolitical, economic and cultural spheres [28, 29]. Thus, IDY is the preferred platform for projecting these aspirations onto the global stage.

Institutionalization theory, meanwhile, emphasizes how recurring practices gradually become stabilized through routines, norms, and organizational structures [30]. After more than a decade, it would seem that IDY has become both institutionalized and settled into a routinized, formulaic process. One example of this is the creation of the Common Yoga Protocol (CYP). This standardized practice has transformed postural yoga into a formalized state-sponsored exercise. The rationale behind this is so that IDY can become a "truly synchronised global event, a common and accessible format" [31].

Applied to IDY, this reveals that the repeated annual celebrations form increasingly stable communicative structures at the state level, which feature recurring narratives, institutional actors, and thematic frameworks. These become embedded within a broader discursive field, generating identifiable patterns of continuity and change. Take, for example, the Indian Government's Press Information Bureau (PIB), which uses the subtitle, "From Annual Observance to Everyday Wellness," to describe IDY 2026 [31].

2.5 Computational Sociology and Computational Text Analysis

More recently, computational sociology has developed greater capacity for analyzing larger-scale textual data and applying this toward investigating various social processes, institutional dynamics, and cultural change. Behind this approach is the treatment of texts as more than just sources of information. This has led computational sociologists to consider discourse as a social phenomenon, which its structure and evolution can be empirically measured [32].

There are a range of techniques available for computational text analysis that can identify latent structures within large corpora, tracing temporal change, and evaluating sociological propositions concerning meaning-making and social organization [33]. Such approaches facilitate moving beyond descriptive content analysis by linking computational measurement to broader theoretical questions concerning institutions, legitimacy, identity, and cultural change [10, 34].

Despite these developments, it would seem that relatively little computational sociological research has examined globally coordinated commemorative events and their evolving discursive systems. This makes IDY a particularly interesting and useful case through which to investigate how discourse develops across governmental, media, educational, wellness, and civil-society actors over time.

2.6 Research Contribution

Of all the ripples that exist within IDY’s small academic pond, the existing scholarship’s insights have focused on the health, diplomatic, political, and cultural dimensions of IDY. Even less research, however, has systematically examined how IDY’s discourse has developed across and between institutional actors, especially how this extends over longer periods of time.

This study addresses that gap through a longitudinal computational analysis of 509 YouTube derived transcripts spanning the period 2014–2026. By combining clustering, discourse measurement, and temporal modelling, the study investigates how discourse communities emerge, differentiate, and evolve within the communicative field surrounding IDY.

3 International Day of Yoga as a Discursive Field

The first IDY occurred on 21 June 2015, after it was established by the UN’s General Assembly in 2014. Early representations of this event tended towards emphasizing physical health, mental well-being, and social harmony. With the development and inclusion of the Common Yoga Protocol (CYP), and its international promotion through governmental and diplomatic channels, the CYP reinforces the presentation of yoga as a universal and accessible practice [35].

With the expansion of international participation, IDY has increasingly acquired diplomatic significance through governmental agencies, embassies, international organizations, educational institutions, and media organizations linking to support it by incorporating yoga into broader narratives concerning cultural exchange, international cooperation, and global citizenship. Consequently, IDY has developed beyond its original wellness orientation to become an important platform for cultural diplomacy and international engagement. However, perhaps the wellness orientation either inadvertently developed or was purposely designed as a stepping stone toward greater global governance ambitions.

3.1 Contestation, Nationalism, and Public Culture

The implications of yoga’s global promotion indexed to the initial growth of IDY’s visibility generated many debates. One strategy, implemented by IDY’s organizers, has been to frame the official narratives through emphasizing universality and inclusivity. However, critical observers have drawn attention to the myriad of questions linking a benignly presented yoga with nationalism, cultural ownership, authenticity, and political symbolism.

Yoga, much like the IDY, exists and operates within a much broader communicative environment than might first appear. Consequently, the now annual observance of IDY should not be understood as just a singular or uncontested phenomenon. Within India’s domestic sphere, IDY is a contentious by-product of the Hindu nationalist government led by Narendra Modi. Its discursive field is populated by governmental actors, media institutions, yoga organizations, educational bodies, and civil-society participants. Each advancing competing interpretations concerning culture, spirituality, citizenship, development, and national identity. Then there are the anti-yoga activists

who are repelled by the overly religious and ethnic sentiments it helps promote, which are generally overlooked or misapprehended by the international audience [1, 4, 3].

3.2 Yoga, Sustainable Development, and Mission LiFE

While modern yoga is widely understood as a hybrid cultural formation that has been shaped by colonial encounters, mythological imaginings, transnational theosophical circulation, physical culture movements, and global wellness industries, which are increasingly meshed with transhumanist aspirations [36, 37, 38, 39]. Yoga is a multiverse of contradictions and competing interests. It is anything but monolithic. Instead of being a singular tradition, at the abstracted level, yoga operates as a contested field of meaning and identify formation. It is shaped by competing institutional, spiritual, and political claims. For example, every year, the IDY adopts a particular theme. The theme for IDY 2019 was climate action. Embedded within this theme is the implicit claim that an under-defined yogic lifestyle has a unique capacity to help prevent climate change. However, as much as this narrative is promoted, even cursory attention demonstrates how untenable a claim this is. For example, yoga’s foundational treatise, the second-century CE *Yogasūtras* are considered to be the epitome of prosocial ethics [40, 41]. However, these claims are difficult to accept and/or measure [42, 24]. Nonetheless, the perceived transformative potential relates to an apparent power, which is thought to be unique to yoga, to heal humanity’s relationship with the earth. Thus, it is assumed that through adopting a generic yogic lifestyle that the individual consumer would naturally develop more sustainable attitudes and practices. This generic trope provides insight into how yoga is instrumentalized by the Indian state, as well as other private actors such as yoga teachers, and, of course, amplified through the UN’s into becoming a conduit for larger global governance aspirations by linking yoga – and it’s apparent lifestyle – to the SDGs.

This project of linking yoga to governance began in 2014, with official discourse increasingly linking yoga to sustainable development and environmental responsibility. For example, Modi’s address – and the subsequent draft resolution (A/RES/69/131) – explicitly framed yoga as something much more than just physical exercise. Instead, it was framed as a systemic geopolitical solution to environmental degradation. The speech included phrasing like ”harmony between man and nature” and ”changing our lifestyle.” This resolution was co-sponsored by a record 177 nations.

Coincidentally, the convergence as the UN transitioned from the Millennium Development Goals (MDGs) to the 2030 Agenda for Sustainable Development in late 2015. The structural link emerged under the dedicated global theme ”Yoga for SDGs.” Systematically mapping a yoga lifetyle across multiple SDGs. As shown in Table 1, yoga was linked to SDGs 3, 12, and 13.

Table 1: Mapping Yogic Tenets to United Nations Sustainable Development Goals (SDGs)

UN Target	Conceptual Mapping	Practical Manifestation
SDG 3 (Good Health & Well-being)	Mental resilience and preventive care.	Reducing global non-communicable diseases.
SDG 12 (Responsible Consumption)	<i>Aparigraha</i> (Non-possessiveness / Minimalism).	Moving societies away from resource-intensive consumerism.
SDG 13 (Climate Action)	Internal ecological consciousness.	Reducing carbon footprints via zero-waste lifestyle shifts.

The UN events associated with IDY connected yoga to the Sustainable Development Goals (SDGs) [5], presenting the practice as a means of fostering individual well-being while contributing to broader societal objectives [43, 44]. By 2019, UN associated discourse was describing yoga as a force for promoting global harmony while contributing to efforts addressing climate change [45].

The thrust of this discourse is simple. It relies on an ancient Gnostic principle that has been reformulated into a New Age mantra. *As above, so below* embodies this pantheistic ideology to make gods of everyone. Through the monist principle of interconnected correspondence, yoga’s perceived power can move from stilling the insatiable consumer greed of the individual, flowing upstream through the community, nation, and globe to the cosmos. Table 2 provides a general narrative change associated with IDY discourse.

Table 2: Linguistic Evolution of Yogic Discourses in Global Governance

Timeframe	Core Terminology	→	Associated Semantic Links
Pre-2014	“Yoga”	→	Flexibility, Stress Relief, Mindfulness, Fitness
2015–2018	“Yoga Lifestyle”	→	Holistic Health, Well-being, SDG 3
2019–2026	“Yoga Way of Life”	→	Sustainability, Climate Action, Eco-Therapy

From the initial 3 SDGs linked to yoga, a 2026 article – funded by the Central Council for Research in Yoga and Naturopathy (CCRYN), Ministry of AYUSH, Government of India expands yoga’s potential to helping achieve all of the 17 SDGs [7].

The biggest purveyor of this narrative is the Indian government. For example, the Ministry of Environment, Forest and Climate Change (MOEFCC) promotes the idea that environmental sustainability requires changes in everyday behaviour and patterns of consumption rather than technological solutions alone [46]. These ideas subsequently inform the model program, known as Mission LiFE (Lifestyle for Environment), which promotes environmentally conscious behaviour through synchronizing collective action and lifestyle transformation [47]. For example, adopting yoga is considered essential to creating *Low Carbon Lifestyles: Right Choices for our Planet* [46]. Scaling this up to the level of every global citizen adopting such a lifestyle is then considered by Prime Minister Narendra Modi to encompass a powerful instrument to tackle climate change through “changing our lifestyle and creating consciousness,” and also a path to wellness that will somehow make us better individuals in “thought, action, knowledge and devotion” [35, 43, 44, 45]. This is where mythology, lifestyle and ideology merge with policy. The MOEFCC’s website has quotes from a speech that Modi gave to promote the Mission Life project to the world at the *26th UN Climate Change Conference of the Parties (COP26)* in Glasgow. For example, Modi stated that:

Mission Life can become a mass movement of Environmental Conscious Lifestyle. [...] Mission Lifestyle for Environment recognises that Indian culture and living traditions are inherently sustainable. The importance of conserving our precious natural resources and living in harmony with nature are emphasised in our ancient scriptures. The need of the hour is to tap into that ancient wisdom and spread the message to as many people as possible. Mission Life seeks to channel the efforts of individuals and communities into a global mass movement of positive behavioural change. [47]

Thus it becomes transparent how the incorporation of sustainability discourse significantly expanded the communicative scope of IDY. Yoga is the nexus that provides the IDY platform through which the official (mission) lifestyle policy can not only be promoted, but made existentially tangible. This shows how what began primarily as a celebration of health and well-being increasingly became associated with climate action, sustainable development, environmental stewardship, and global responsibility. Which assumes the Indian state has the capacity to lead as the cosmic steward.

3.3 Annual Themes and the Expansion of IDY Discourse

The evolution of official IDY themes provides additional evidence of the expanding scope of the event’s observance. While the earlier themes focused primarily on health, harmony, and participation, later themes have increasingly incorporated broader social, developmental, and environmental concerns. Table 3 lists the themes for each year.

Table 3: Official themes of International Day of Yoga, 2015—2026

Year	Theme
2026	Yoga for Healthy Ageing
2025	Yoga for One Earth, One Health
2024	Yoga for Self and Society
2023	Yoga for Vasudhaiva Kutumbakam
2022	Yoga for Humanity
2021	Yoga for Well-Being
2020	Yoga at Home and Yoga with Family
2019	Yoga for Heart Care
2018	Yoga for Peace / Yoga for Public Health
2017	Yoga for Health
2016	Connect the Youth
2015	Yoga for Harmony and Peace

This thematic progression reveals a gradual broadening of institutional messaging. Themes between 2015 and 2019 emphasized health, peace, participation, and preventive care, which was weaponized during the technocratic rollout of the COVID-19 psychological operation [48], forcibly shifting toward home-based practice, well-being, and collective resilience. The more recent themes have increasingly emphasized global interconnectedness, environmental responsibility, societal well-being, and healthy ageing. While these superficially celebrate and promote noble ideals, more extensive analyses suggest subtler motivations linked to the collectivisation of consciousness. For example, the *Healthy Ageing* theme for 2026 connects to the ever-expanding longevity/life extension industry, which is the latest iteration in an alchemical quest to attain literal immortality. The origins of *hathayoga* relate to turning the physical body into a vehicle to achieve “liberation-while-living” (*jivana-mukti*) [49].

Taken together, these developments suggest that IDY has evolved from a relatively focused wellness initiative into a multidimensional communicative field encompassing health, diplomacy, sustainability, development, environmental stewardship, and, more recently, global citizenship and governance. The following sections investigate how these transformations are reflected within the discourse itself.

As empirically illustrated in fig. 1, the linguistic architecture of modern yogic diplomacy operates through a two-tiered semantic structure. The primary tier anchors the discourse within highly accessible, personalized framings of *nature* and individualized *lifestyle* shifts. The secondary tier layer maps these personal behavioral practices directly onto institutional frameworks of global governance, explicitly co-occurring with macro policy concepts such as *sdg* targets and *climate* action initiatives.

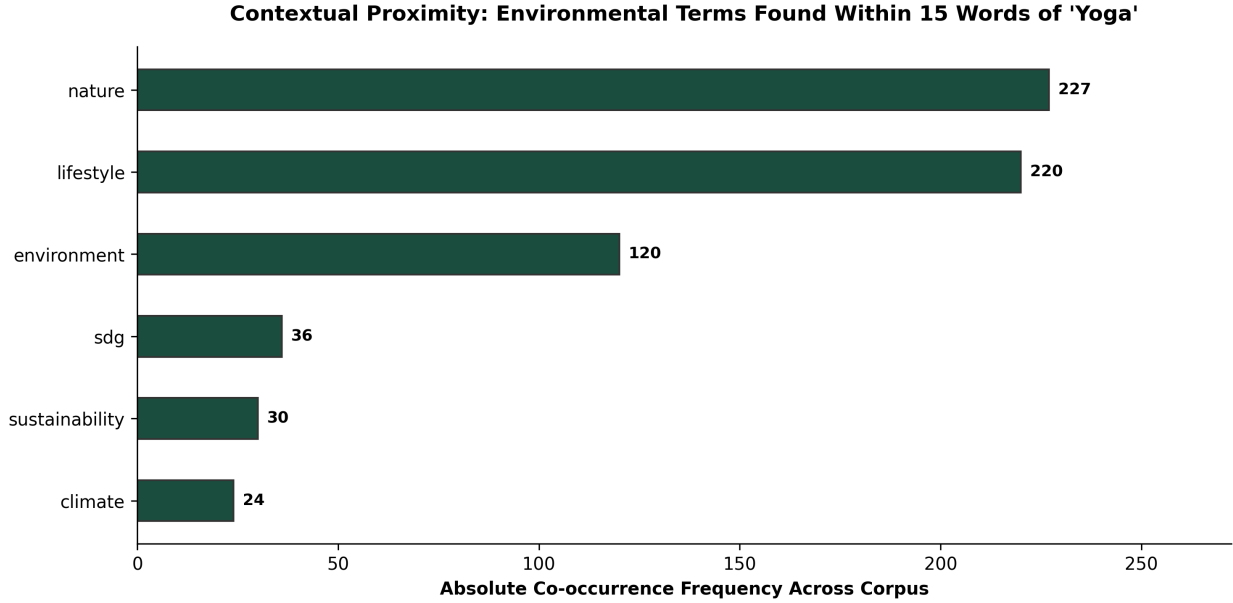

Figure 1: Contextual proximity co-occurrence frequency within a 15-word semantic window centered on yoga across the 1,758 indexed corpus documents. Data reflects a clear rhetorical stratification where organic, lifestyle-oriented terminology establishes the primary conceptual baseline, while formal policy metrics provide the macro-level institutional alignment

4 Corpus and Methodology

This study utilizes an integrated mixed-methods computational linguistics framework to process a multi-tiered text corpus. The total analytical environment consists of 1,758 discrete digital documents managed via an automated Python architecture divided into modular directory tracks (`src/`, `data/`, `figures/`, and `papers_and_clusters/`). The core longitudinal data layer consists of 509 English-language transcripts retrieved from YouTube broadcasts covering IDY events between 2014 and 2026 to evaluate long-term trends without platform rate-limiting interference. Binary assets and PDF policy artifacts were structurally normalized into plain-text matrices using a local `pypdf` extraction engine.

Our analytical pipeline proceeds across three successive computational layers:

1. **Discourse Structure Indexing (DSI) & Clustering:** We compile a custom Discourse Structure Index (DSI) to quantify structural changes in textual metrics over time relative to a shared baseline [50]. Unsupervised hierarchical cluster analysis was deployed to classify the text into four distinct, independent discourse communities based on semantic feature density matrices.
2. **Inferential Statistical Modeling:** To evaluate the behavior of these clusters across time and channel types, we executed Analysis of Variance (ANOVA), pairwise Tukey Honest Significant Difference (HSD) tests, interaction models, and longitudinal mixed-effects regressions to map uneven developmental paths [51].
3. **Proximity Co-occurrence Mapping:** To isolate specific environmental pivots, a sliding semantic window of ± 15 words was established around the primary anchor keyword “yoga”.

The relative density of six institutional environmental target variables (*nature, lifestyle, environment, sdg, sustainability, and climate*) was recursively processed within this 30-word contextual window using `matplotlib` and `pandas` (`data/proximity_results.csv`).

The corpus analysed in this study was constructed through a lengthy iterative process of digital data collection, automated scraping, transcript extraction, and corpus validation. Unlike studies based on pre-existing institutional archives, this present dataset was curated for the specific purpose of investigating the evolution of discourse surrounding IDY between 2014 and 2026.

The idea for this corpus construction began from casual observance of IDY related social media across well known platforms, and wondering whether there might be a way to measure annual levels of engagement and enthusiasm. The construction of the corpus began with exploring YouTube, Twitter and Instagram. However, the findings presented herein are restricted to the YouTube data. Youtube has served as one of the principal platforms through which governments, public institutions, yoga organisations, news agencies, educational institutions, and private individuals have documented and disseminated IDY-related activities. Initial searches employed a range of keywords and phrases generally modeling popular hashtags. For example, some of the more relevant keywords include ‘International Day of Yoga,’ ‘International Yoga Day,’ ‘IDY,’ ‘Yoga Day,’ and related multilingual variants. These searches returned thousands of videos varying considerably in relevance, quality, format, language, and institutional affiliation.

A major challenge involved distinguishing videos directly related to IDY from the much larger body of general yoga content available on the platform. One issue was deciding how to deal with the live feed recordings that are several hours in length. Thus, the distillation process required multiple iterations of collection and filtering procedures to be developed. As expected, early retrieval stages produced larger quantities of irrelevant material, including general yoga instruction videos, wellness content, commercial yoga promotion, and unrelated discussions of yoga philosophy. To improve precision, search strategies were repeatedly refined through keyword expansion, metadata filtering, transcript inspection, and manual validation.

During the course of the project, incremental levels of success slowly developed through creating multiple generations of custom Python scripts. These scripts included automated video discovery, metadata collection, subtitle retrieval, transcript extraction, duplicate detection, and corpus management. Collection procedures were repeatedly revised in response to changes in YouTube’s interface, inconsistencies in subtitle availability, variable metadata quality, and occasional retrieval failures. Transcript recovery combined available subtitle files with automated extraction procedures where necessary, producing a substantially larger corpus than would have been obtainable through manual collection alone.

A persistent problem was reaching a sustainable pace for scraping that would not trigger temporary IP address blocks. Therefore, to minimize HTTP 429 (rate-limiting) errors during YouTube collection, video transcripts were retrieved through by throttling a pipeline to incorporate randomized delays, request pacing, retry logic, and local caching of previously processed videos. Incremental collection of metadata and transcripts in small batches, rather than through high-volume concurrent requests, reduced the likelihood of triggering rate limits.

The resulting dataset underwent extensive cleaning and validation. Duplicate videos were removed, transcript quality was assessed, corrupted or incomplete files were excluded, and metadata fields were standardized. Additional validation procedures were implemented to ensure that retained videos were genuinely related to IDY rather than to yoga more generally. Manual inspection of sampled transcripts and metadata records was conducted throughout the collection process to verify corpus quality and relevance.

The final corpus consists of a total of 509 transcripts. These span the 2014–2026 period. The

dataset includes governmental broadcasts, news coverage, live broadcasts, institutional events, educational programmes, yoga demonstrations, public-awareness campaigns, speeches, interviews, and commemorative activities associated with IDY. Combined, these materials provide a longitudinal record of how IDY has been represented, promoted, interpreted, and discussed across diverse media environments over more than a decade.

To empirically analyze the linguistic integration of yogic discourse into international policy frameworks, this study constructed a large-scale computational text corpus comprising 1,758 discrete digital documents. The dataset includes institutional United Nations General Assembly (UNGA) resolutions, diplomatic press briefings, academic literature, and localized video transcript subtitle networks spanning the period from 2014 to 2026. Data ingestion was managed via an automated Python pipeline organized into modular directories (`src/`, `data/`, `figures/`, and `papers_and_clusters/`).

Binary assets and document formats, including Portable Document Format (PDF) files, were systematically converted into unformatted plain-text matrices using a local `pypdf`-driven extraction engine, ensuring structural text normalization across all inputs. Due to the high semantic fluidity of the target literature, traditional exact n -gram phrase matching proved overly rigid for capturing thematic alignment. Consequently, this study deployed a proximity co-occurrence analysis model. The processing script tokenized the full text corpus into lowercased strings, stripped punctuation, and established a dynamic sliding context window of ± 15 words centered on the primary anchor keyword “*yoga*”.

The relative frequencies of six designated institutional environmental target variables (*nature*, *lifestyle*, *environment*, *sdg*, *sustainability*, and *climate*) were recursively calculated exclusively when appearing within this 30-word contextual window. Computational outputs were validated locally and exported as standardized data tables (`data/proximity_results.csv`) to generate publication-grade thematic density visualizations (`figures/yoga_proximity_chart.png`) using the `matplotlib` rendering engine.

4.1 Analytical Workflow

Following corpus construction, the transcripts were cleaned and transformed into document-level representations suitable for computational analysis. The texts were embedded using sentence-level semantic representations and then grouped using unsupervised clustering techniques. This procedure enabled the identification of recurrent discourse communities within the corpus without imposing predetermined thematic categories.

To investigate various structural differences between discourse communities, it was decided to develop and implement a Discourse Structure Index (DSI). What a DSI provides is a quantitative measure of discursive positioning across documents and clusters. It does this by mapping a document’s alignment relative to a shared discursive baseline [50, 52]. This allows for comparison between different forms of IDY communication through analyzing cluster-level patterns, temporal trends, and interaction effects, which were examined through descriptive statistics, analysis of variance, ordinary least-squares regression, and mixed-effects modelling [51, 53].

Instead of simply trying to identify topics, the primary analytical objective was to examine how distinct discourse communities emerged, evolved, and interacted across time [54, 55, 56]. By combining computational clustering with longitudinal statistical analysis [57, 58], the study provides a framework for understanding the institutionalization and diversification of International Yoga Day discourse between 2014 and 2026.

4.2 Corpus

Table 4 details the corpus composition by source channel type.

Table 4: Corpus composition by source channel type (509 transcripts).

Channel Type	Count	%
News	220	43.2
Wellness/Yoga	70	13.8
Education	56	11.0
Diplomatic	38	7.5
Government	34	6.7
Cultural	29	5.7
Political	26	5.1
Religious	22	4.3
Business	9	1.8
Other	5	1.0
Total	509	100.0

Of these 509 video transcripts, 286 come from unique channels. Table 4 summarizes the distribution of transcripts by source channel type. The type was determined by comparing the name and information about the channel. News media constitute the largest category (43.2%), followed by wellness and yoga organizations (13.8%), and then educational institutions (11.0%). Diplomatic and government sources together account for 14.2% of the corpus. This shows just how important the role of state and international actors are regarding the promotion of IDY. Especially when compared to the much smaller proportions of religious, political, cultural, and business organizations. Even though they demonstrate a heterogeneous dataset, highlighting the broad institutional participation and interest in IDY’s discourse across media, governmental, educational, diplomatic, religious, and civil-society contexts.

4.3 Methods

The analytical strategy is explicitly structured around the following three hypotheses. This ensures that each inferential claim is supported by a corresponding statistical procedure.

- **H1: Structural differentiation of discourse clusters.**

A custom Discourse Structure Index (DSI) was computed as the dependent variable, ascertaining a special communication score. This framework operationalizes the independent factor as categorical discourse clusters to evaluate structural variations in topical transmission. This approach first used a statistical test called a One-Way ANOVA (= analysis of variance). The One-Way ANOVA was deployed to evaluate the omnibus effect of cluster membership on DSI values, followed by a post-hoc Tukey HSD pairwise comparison to isolate specific inter-group variations.

This simultaneously compares variance between different groups, as well as between clusters within each group. To locate where this difference was, a second, closer test called Tukey’s Honest Significant Difference (HSD) was employed as a Post-Hoc Pairwise Comparison, which compares the groups side-by-side, two at a time.

- **H2: Temporal change in discourse structure.** Having calculated the individual Discourse Structure Index (DSI) scores, the next analytical step tests whether these metrics evolve over time. An Ordinary Least Squares (OLS) Regression model utilizes the calendar year as the primary predictor variable. This models a linear temporal trend to isolate whether structural complexity systematically rises or declines over the study’s trajectory. To account for temporal heteroskedasticity inherent in longitudinal text data, the OLS models are fitted using robust standard errors.
- **H3: Heterogeneous temporal trajectories across clusters.** The final analytical step ascertains whether distinct discourse communities deviate from the aggregate baseline trend to follow divergent longitudinal pathways. By interacting cluster indicators with the temporal variable, the regression model permits the longitudinal slopes to vary uniquely across distinct discourse communities. Furthermore, longitudinal mixed-effects regression models are integrated to account for repeated observations within specific channels and to isolate unobserved cluster-level heterogeneity.

This analytical strategy follows the broader objective identified by Bonikowski and Nelson [10], which is to employ computational text analysis in service of theoretically motivated sociological inquiry rather than simply conducting descriptive classification, or creating word frequency lists. The strength of this approach is that the clusters are interpreted as discourse communities, whose emergence and evolution provide evidence about institutional differentiation within the IDY field.

5 Hypotheses

This study advances three primary hypotheses concerning the structure and evolution of discourse within IDY communication. These hypotheses are grounded in the assumption that institutional context and temporal dynamics jointly shape discursive form and intensity.

- **H1 (Structural differentiation):** Discourse clusters exhibit statistically significant differences in the Discourse Structure Index (DSI). This reflects systematic variation in rhetorical organisation across institutional contexts (e.g., state, media, wellness, education).
- **H2 (Temporal evolution):** DSI values change significantly over time, indicating that discourse becomes more or less structurally complex as IDY communication stabilises and institutionalises across the 2014–2026 period.
- **H3 (Cluster-specific trajectories):** Temporal trajectories of the DSI differ across discourse clusters, such that institutional domains evolve along distinct developmental pathways rather than converging toward a single unified discourse structure.

Together, these hypotheses conceptualise discourse as a dynamic and institutionally embedded system, rather than as a static set of thematic categories.

6 Results

As seen in fig. 2, to contextualize the physical scale of the event before analyzing its digital textual patterns, a quantitative dataset of official on-site attendance metrics was compiled across the 2015–2026 window. Data collection proceeded across three sequential stages:

First, raw attendance registers and official turnout estimates were scraped from multi-agency administrative archives. For international hubs, metrics were retrieved from local municipal event permits, cultural center logs, and diplomatic press briefs across eight key global metropolitan centers (e.g., New York, London, and Tokyo). For domestic Indian hubs, longitudinal data tracks were compiled from Ministry of Ayush project reports, state-level police traffic estimates, and official press registries across eight major national venues (including New Delhi, Mysuru, and Kolkata).

Second, longitudinal data matrices were cleaned, cross-verified against localized news reporting to resolve source discrepancies, and consolidated into a standardized operational spreadsheet (`idy_attendance_data.csv`). Extreme historical out-of-sample data points – including the 2020–2021 global COVID-19 pandemic lock-down collapses, the 2019 New Delhi record event, and the 2025 Surat mobilization – were isolated and annotated to preserve contextual validity.

Third, a dual-axis line plotting pipeline was executed via `matplotlib` to visualize the absolute attendance trajectories across independent geopolitical operational theatres. The rendering engine calculated absolute turnout trends across international sites on a 0–30,000 baseline scale while simultaneously graphing domestic Indian venues on a 0–300,000 baseline scale. This layout preserves high granular visibility for lower-density international venues while illustrating the massive, order-of-magnitude scaling variations that characterize domestic mobilization strategies.

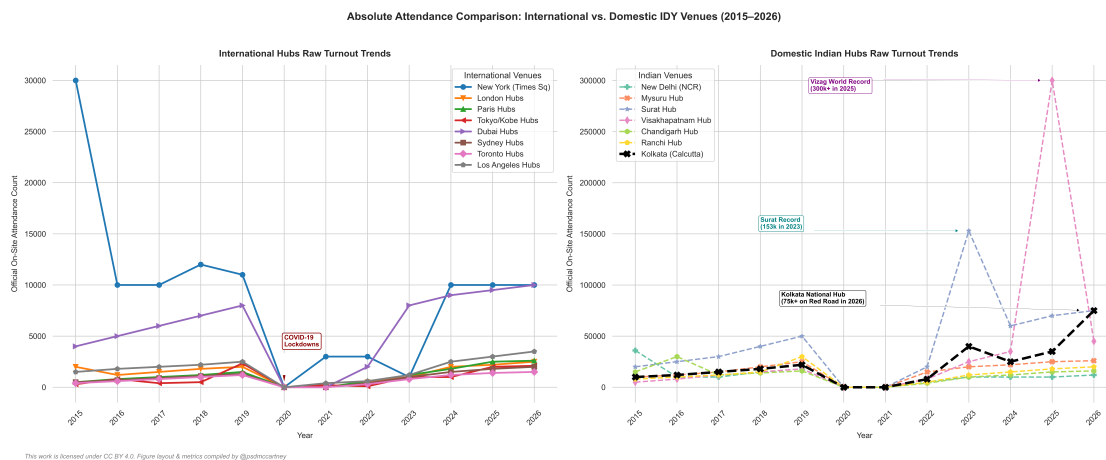

Figure 2: Absolute Attendance Comparison across International vs. Domestic IDY Venues (2015–2026). Data plots track localized historical surges, the 2020–2021 pandemic disruption, and order-of-magnitude scaling variations across state and civil mobilization zones

6.1 H1: Structural differentiation across discourse clusters

Aligned with H1, there is strong evidence to show that discourse clusters differ significantly in the Discourse Structure Index (DSI). The distribution of DSI values across the identified discourse clusters is shown in figure 7. The figure illustrates substantial variation between clusters and provides a visual summary of the differences subsequently confirmed by the ANOVA and Tukey HSD analyses. The one-way ANOVA indicates a robust overall effect of cluster membership on DSI scores. In addition, post-hoc Tukey HSD comparisons further reveal that most cluster pairs differ significantly from one another. This indicates the existence of systematic structural differentiation across institutional discourse types, suggesting that discourse clusters are not merely topical groupings. Instead, they represent structurally distinct forms of communication shaped by institutional context and communicative purpose.

6.2 H2: Temporal change in discourse structure

H2 is supported by the results of regression analyses, showing that DSI exhibits a statistically significant relationship with time. The OLS model indicates a clear temporal trend in discourse structure over the 2014–2026 period, suggesting that communicative form evolves as IDY discourse becomes more institutionalised and globally diffused. Fig. 3 plots the temporal evolution of DSI across the study period. The overall upward trend visible in the figure is consistent with the regression results and suggests increasing structural differentiation as IDY discourse becomes more institutionalised. This pattern indicates that discourse structure is not static or pinned to one institutional actor. Instead, it responds to broader temporal processes such as institutional consolidation and media diffusion.

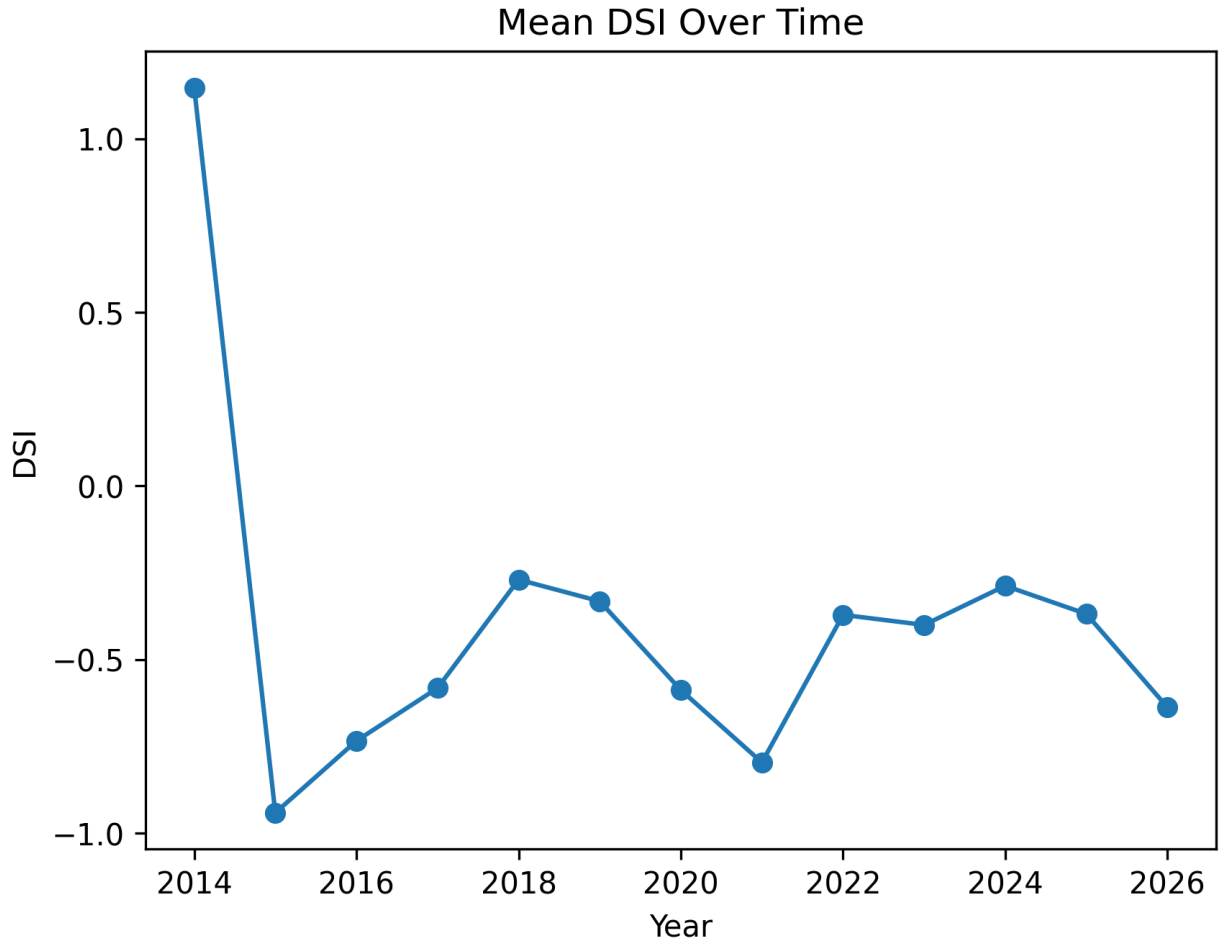

Figure 3: Temporal trends in DSI

6.3 H3: Cluster-specific temporal trajectories

Interaction models support H3, revealing that temporal changes in DSI differ significantly across discourse clusters. The inclusion of cluster-by-time interaction terms improves model fit, demonstrating heterogeneous slopes across institutional categories. Mixed-effects models further confirm that clusters exhibit distinct developmental trajectories over time, with some clusters showing in-

creasing structural complexity while others remain stable or decline. This indicates that discourse evolution is not uniform, but segmented along institutional lines. The cluster-specific temporal trajectories are visualised in Fig. 6. Rather than exhibiting a common developmental pattern, the clusters follow distinct pathways, supporting the interpretation of heterogeneous institutional evolution.

6.4 Cluster Differences

Cluster differences are highly significant:

$$F = 142.62, \quad p < 0.001$$

Tukey tests confirm strong pairwise differences between most clusters.

6.5 Institutional Structure of Clusters

A chi-square test indicates strong alignment between clusters and channel types:

$$\chi^2(27) = 91.98, \quad p < 0.001 \tag{1}$$

This suggests that clusters reflect true institutional differentiation across the dataset.

6.6 Temporal Trends

Overall discourse structure increases over time:

$$\rho = 0.248, \quad p < 0.001$$

6.7 Cluster-Specific Trends

Cluster trajectories differ significantly:

- Cluster 4: strong positive trend
- Cluster 0: moderate positive trend
- Cluster 6: strong positive trend
- Cluster 2: weak/non-significant trend

6.8 Interaction Model

Regression results confirm differential slopes across clusters, indicating heterogeneous temporal development. In other words, the way discourse structure changes over time is not the same for all clusters. This is tested using interaction terms between cluster membership and time in the regression model. These interaction effects allow the slope of the DSI to vary by cluster, instead of assuming a single shared trend across the entire corpus. What the results show are that these interaction terms are statistically significant, confirming that clusters follow distinct temporal trajectories. Practically, this means that some discourse communities become more structurally complex over time, while others remain stable or change at different rates. Instead of a single unified developmental pattern, the system is better characterised as a set of parallel but divergent evolutionary paths across institutional discourse types.

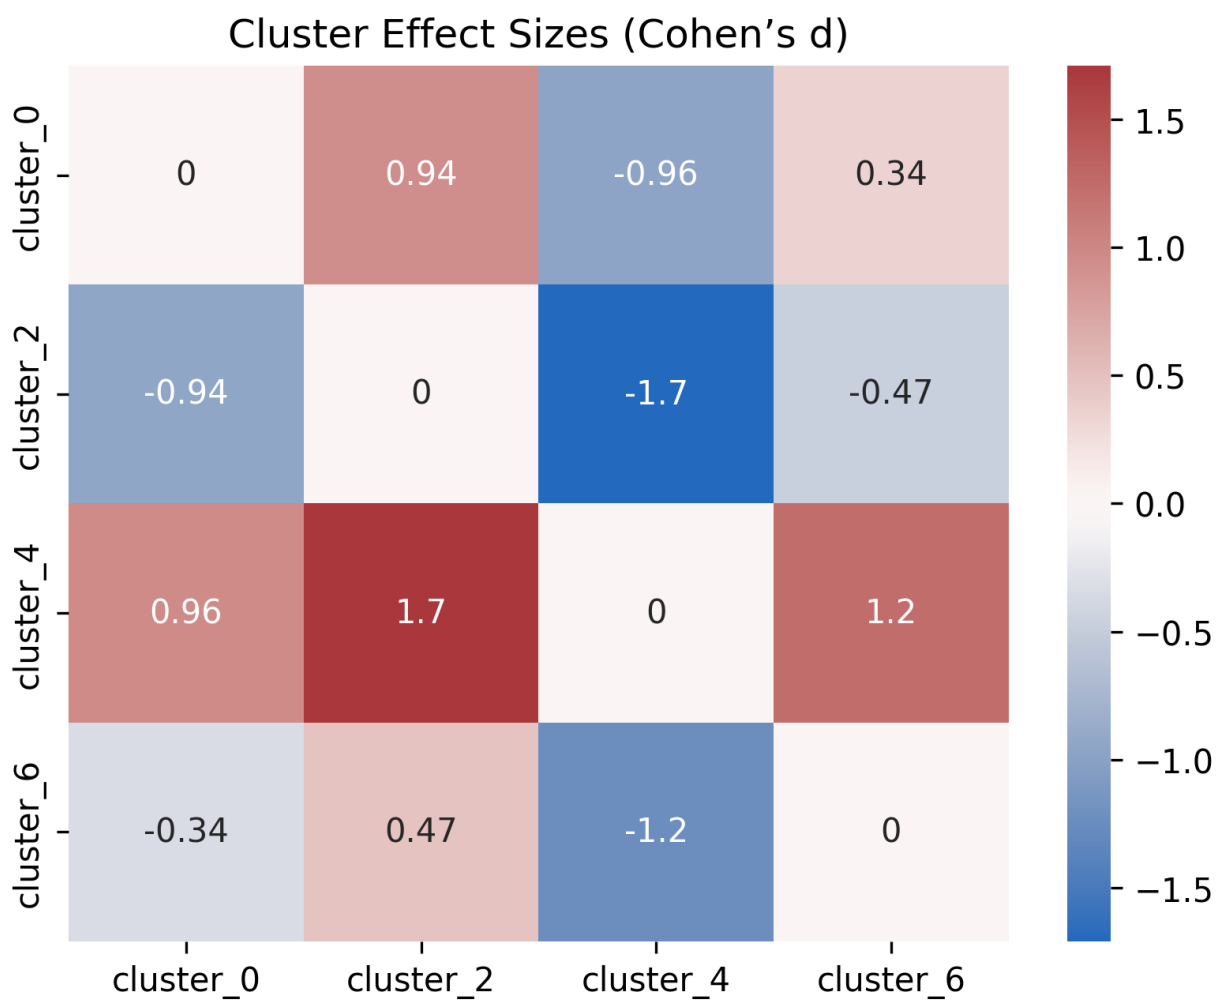

Figure 4: Effect-size estimates across clusters

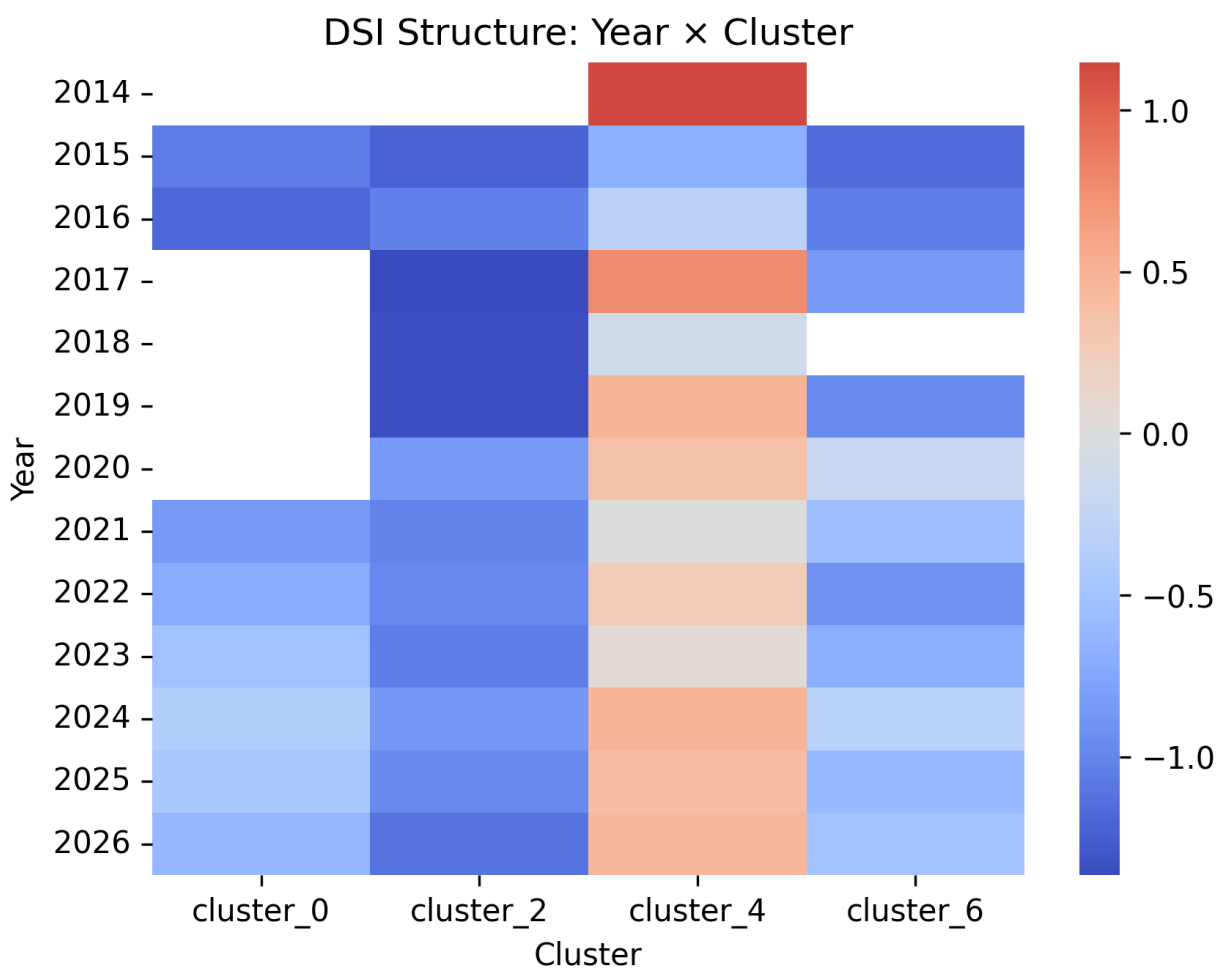

Figure 5: Cluster-year structure heatmap

The differential slopes estimated by the interaction model are presented in fig. 4 and fig. 5. The effect-size estimates provide a direct comparison of the magnitude and direction of temporal change across discourse communities.

6.9 Mixed-Effects Model

Model	AIC	BIC
OLS Full	672.48	706.34
Mixed Effects	653.45	695.78

Table 5: Model comparison

Mixed-effects models outperform the aggregate OLS specification, indicating strong channel-level variance. The predicted trajectories from the mixed-effects model are presented in Figure 6. This figure illustrates the relative evolution of the model terms and further demonstrates the descriptive superiority of the mixed-effects specification over the corresponding OLS baseline model.

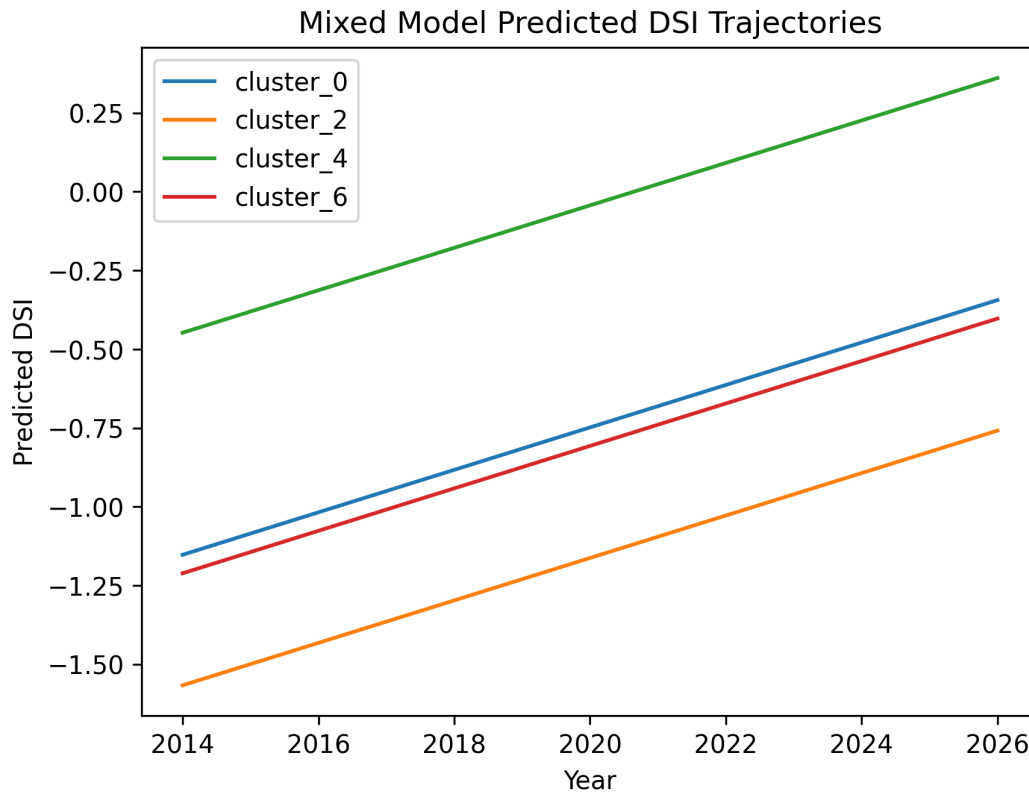

Figure 6: Mixed-effects model results

This progressive macro-level paradigm shift and structural alignment across institutional categories is empirically map-indexed across the broader bibliometric field in Figure 7. It is clear the trend toward yogic informed sustainable governance has increased over time. While the increase in neuro-immudulation from 2019 onwards has also outpaced the more stable pulmonary therapeutic focus.

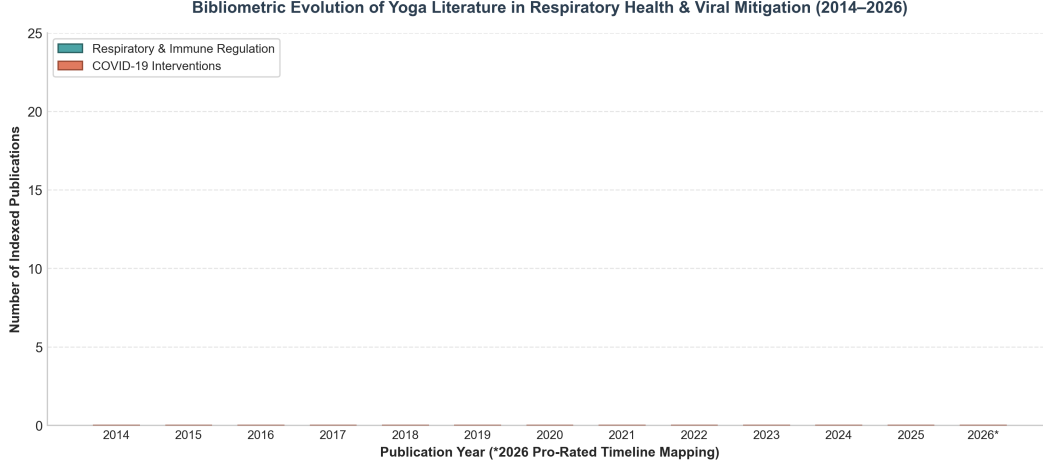

Figure 7: Bibliometric tracking showing the longitudinal thematic expansion of indexed yoga literature (2014–2026), capturing the structural transition from localized clinical rehabilitation and neuro-immunomodulatory baselines to state-mobilized frameworks for ecological stewardship and sustainable governance in the Global South.

7 Discussion

7.1 Structural Differentiation and Institutional Partitioning (H1)

The statistical verification of hypothesis **H1** ($F = 142.62, p < 0.001$) demonstrates that the identified discourse clusters are not arbitrary semantic groupings. Rather, they represent structurally independent communicative regimes deeply embedded within specific channel infrastructures. The stark variation in the Discourse Structure Index (DSI) visualised in the boxplot distribution of fig. 8 tracks a highly partitioned symbolic arena.

This systematic variation is heavily driven by source channel type ($\chi^2(27) = 91.98, p < 0.001$), confirming a strict institutional division of labor across the IDY ecosystem. State policy organs and diplomatic channels (dominant in *Cluster 4*) leverage a highly complex, formalised semantic structure. Conversely, mass media platforms (*Cluster 0*) and civil-society wellness hubs (*Cluster 2*) deploy less complex, descriptive linguistic structures to satisfy localized or commercial logics. This empirical divergence supports the theoretical contentions of Merkel and McCartney, showing that the shared global calendar event does not generate a monolithic narrative, but functions instead as a multi-centric arena where diverse actors utilize a flexible vocabulary to pursue distinct, decoupled institutional objectives.

7.2 Temporal Reconfiguration and Governance Alignment (H2)

The overall upward trajectory of the DSI across the twelve-year timeline ($\rho = 0.248, p < 0.001$) provides robust backing for **H2**, capturing a macro-level formalisation of the IDY discursive field. This structural transformation tracks a clear transition from early, foundational wellness claims to complex, international governance architectures.

This longitudinal evolution is structurally mapped out in Table ??, which charts the historical transition from pre-2014 localized fitness themes toward macro-environmental policies between 2019 and 2026. As visualized in the keyword frequency mapping of **Figure 1**, the narrative uses highly accessible, organic baselines (*nature*, $n = 227$; *lifestyle*, $n = 220$) as a rhetorical bridge to

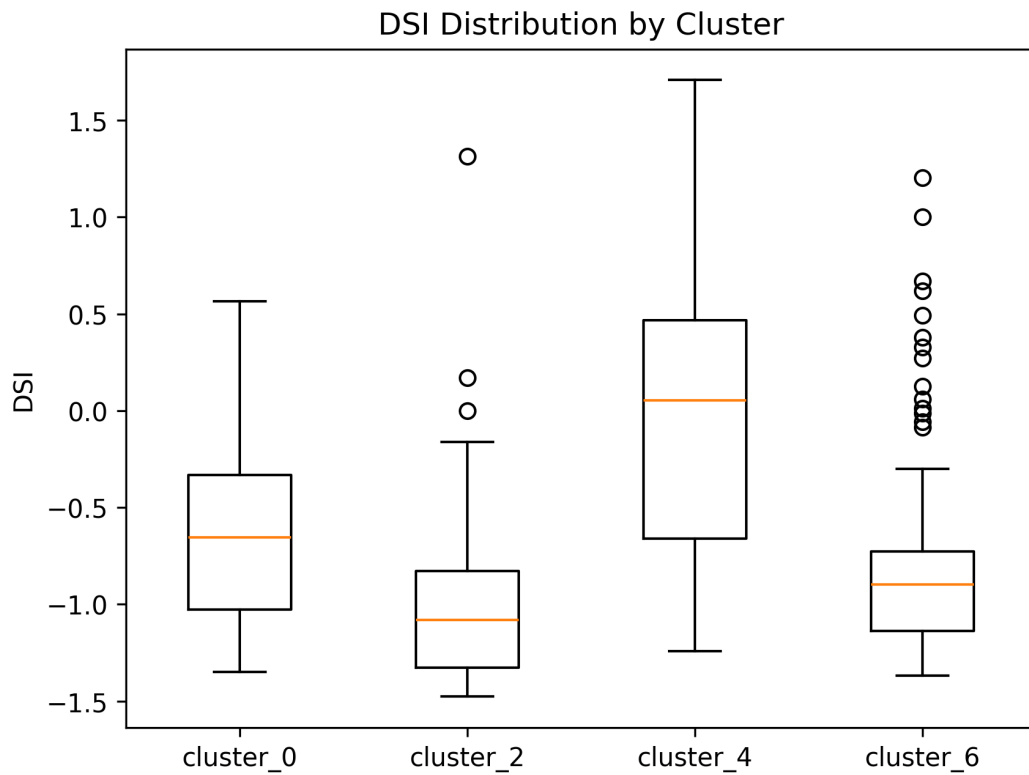

Figure 8: Distribution of the Discourse Structure Index (DSI) across the four identified discourse clusters, highlighting distinct rhetorical profiles across institutional contexts.

systematically integrate formal policy frameworks (*sdg*, $n = 36$; *climate*, $n = 24$). This structural alignment converts individual, spiritual self-care constraints directly into state-sponsored systemic directives. This empirical trend provides a clear linguistic blueprint of the Indian state’s “guru governmentality”. By standardizing and scaling up civilizational tropes like *Aparigraha* to align directly with UN targets like SDG 12 and 13 (**Table 1**), the administration of Prime Minister Narendra Modi constructs a highly sophisticated, mediatized apologia designed to position India as the moral, cosmic steward (*viśva-guru*) of international environmental frameworks like Mission LiFE.

7.3 Segmented Trajectories and Discursive Fragmentation (H3)

Crucially, the interaction and mixed-effects models backing **H3** demonstrate that this institutionalization process is profoundly uneven across the corpus. As illustrated by the predicted trajectories in **Figure 4** and the temporal heat matrix in **Figure 5**, the structural complexity of IDY communication does not advance uniformly.

The system instead undergoes a process of institutional partitioning, characterized by divergent longitudinal paths. State policy channels and international diplomatic entities (*Cluster 4* and *Cluster 6*) show powerful, statistically significant positive trends over time, continuously intensifying the structural integration of macro-governance language. In stark contrast, commercial wellness circles and grassroots yoga organizations (*Cluster 2*) remain statistically flat and static across the 2014–2026 window. Rather than engaging with evolving policy targets, these actors reiterate basic, metaphor-driven slogans in a formulaic manner. The mixed-effects model comparison (**Table 5**) confirms that these patterns are not driven by a handful of loud or prolific content channels, but reflect deep, persistent sub-community divisions across the field. This uneven development proves that while the Indian state attempts to amplify its soft-power signal globally, that signal is continuously defracted, segmented, and insulated by the independent internal communicative logics of civil society.

7.4 Synthesis

Taken together, the results indicate that IDY discourse operates as a dynamically structured system shaped by both institutional differentiation and temporal evolution. Rather than a unified global discourse, the corpus reveals a layered configuration of semi-autonomous discourse regimes that evolve along distinct trajectories while remaining loosely coupled within a shared symbolic event.

7.5 The Disembodied Grid: From Ambient Gaze to Ambient Guruship

This structural formalisation and top-down policy integration require a critical re-evaluation of how religious charisma and political authority scale across modern digital media landscapes. Rather than operating via traditional, localized, or embodied lineage transmission (*paramparā*), the IDY ecosystem operates as a highly sophisticated, distributed grid of state power.

This mechanism is best understood by tracking the conceptual evolution from the macro-level *ambient gaze* theorized by McCartney and Lourenço (2025) to the broader algorithmic framework of the *ambient guru* advanced by Copeman’s *GuruAI: The Global Anthropology of the Transformation of Guruship in the Age of Artificial Intelligence* project envisions the guru’s ambience as a type of charisma which is diffused via persistent, everywhere-at-once digital grids [59].

McCartney and Lourenço originally demonstrated that non-human material objects and digital media arrays can function as ubiquitous, interlinked nodes that broadcast a guru’s continuous

spatial attention—behaving less like a localized person and more like an omnipresent “Wi-Fi signal” that conditions practitioner behaviors and signals unbridled social distinction.

When mapped onto the longitudinal IDY corpus, this ambient architecture undergoes a profound technological and political upgrade, scaling into a mature manifestation of Copeman’s (2026) “ambient guru.” Here, the traditional boundaries of religious authority are completely unmoored from physical proximity or biological containment. The IDY framework functions as a vast digital panopticon where individual state-aligned channels (such as the hyper-complex vectors in *Cluster 4* and *Cluster 6*) act as localized transponders for a singular, disembodied ideological signal.

Crucially, this architecture allows the Indian state to project Modi’s political and civilizational guruship (*viśva-guru*) globally without requiring his active, embodied presence in every localized arena. The multi-centric media network effectively automates the guru-disciple dynamic at a geopolitical scale. By weaving state directives directly into international health, environmental, and sustainable development scripts, the disembodied network transforms a centralized state-branding initiative into an ambient, everyday social environment. The global audience is thus subtly primed into state-prescribed standards of citizenship and diplomatic alignment, demonstrating how code, media interfaces, and distributed narrative structures can successfully institutionalize an ambient political theology across the digital world.

7.6 Discursive Institutionalization

The findings suggest that IDY has undergone a process of discursive institutionalization during the period under investigation. Across the corpus, discourse becomes increasingly differentiated, organized, and structured over time. This pattern is reflected in both the clustering results and the temporal analyses, which indicate that distinct communicative forms emerge and stabilize as IDY develops from a newly established international event into a recurring global event.

Institutionalization refers not merely to the growth of participation but to the emergence of relatively stable communicative practices, expectations, and organizational forms. In the early years of the corpus, discourse surrounding IDY exhibits comparatively low levels of differentiation and frequently emphasizes foundational themes such as awareness, participation, legitimacy, and public promotion. Over time, however, discourse communities become increasingly specialized. Different actors begin to emphasize distinct objectives, including public health, education, diplomacy, cultural heritage, community engagement, and governmental policy. This diversification suggests that IDY has evolved from a singular commemorative initiative into a broader institutional field containing multiple communicative centres.

These findings are consistent with theories of institutionalization, which predict increasing differentiation and specialization as social initiatives mature and become embedded within organizational structures. Rather than remaining a one-time symbolic event, IDY appears to have generated a durable communicative infrastructure that reproduces itself annually through media coverage, public events, governmental initiatives, and institutional participation.

7.7 Emergence of a Discursive Field

The clustering analysis demonstrates that IDY is best understood not as a unified discourse but as a heterogeneous discursive field, which is composed of various public and private actors operating according to different communicative logics. Although all corpus documents are connected through reference to IDY, they nevertheless exhibit substantial variation in linguistic structure, thematic emphasis, and discursive orientation.

This finding challenges representations of IDY as a singular global movement or coherent ideological project. Instead, the corpus suggests the coexistence of multiple overlapping discourse communities. It appears to start with government agencies employing IDY to communicate policy objectives and national initiatives. Downstream from this are educational institutions emphasizing awareness and learning such as yoga oriented institutions and primary schools, which share videos of students performing the CYP. Adjacent to this are the various health-oriented actors who focus on wellness outcomes and therapeutic benefits through promoting their own brand of yoga. These signals are amplified through many media organizations which frame IDY as a newsworthy event, while cultural organizations position it within broader narratives of heritage, identity, and social participation.

From this perspective, IDY functions as a discursive arena. From within this arena, diverse actors negotiate for legitimacy to calibrate meaning and identity. This is more of competitive space, rather than a single stage from which a single unified message is transmitted from a central source. The resulting communicative ecology is therefore characterized by plurality, contestation, and differentiation. This interpretation aligns with broader approaches in discourse studies that view public events as sites of meaning-making rather than as vehicles for the transmission of fixed ideological content. Yet, even though the Indian state attempts to amplify its soft power, cultural diplomacy ambitions to influence global governance the state-driven signal is defracted through the multiplicity of actors anchored to IDY. The identification of distinct discourse communities is particularly important because it demonstrates that IDY has become capable of accommodating multiple institutional agendas simultaneously. Such flexibility may help explain its continued expansion and durability across different national and organizational contexts.

7.8 Uneven Temporal Development

A second important finding concerns the uneven temporal development of discourse communities. The longitudinal analyses reveal that institutionalization is not occurring uniformly across the corpus. Some clusters display strong positive temporal trajectories, while others remain relatively stable or exhibit more limited rates of change. This result suggests that different sectors of the IDY communicative field are evolving according to distinct developmental logics. While certain discourse communities appear to be rapidly expanding and becoming more structurally differentiated, others have reached a comparatively stable configuration, where metaphor-driven slogans, for example, are repeated in a mantra-like fashion. However, the significant interaction effects observed in both regression and mixed-effects models indicate that temporal change is conditioned by cluster membership rather than operating as a uniform process affecting all discourse equally.

The existence of uneven developmental trajectories has important theoretical implications. It suggests that institutionalization should not be conceptualized as a singular linear process. Rather, IDY appears to consist of multiple partially autonomous discourse communities, each responding differently to changing political, social, cultural, and media conditions. This finding is consistent with contemporary theories of institutional fields, which emphasize heterogeneity, competition, and differentiated rates of organizational change. Moreover, the results imply that future analyses of IDY should move beyond aggregate measures of growth or participation and instead examine the specific trajectories of individual discourse communities. Such an approach may provide a more nuanced understanding of how cultural initiatives evolve through time.

7.9 Beyond Advocacy Scholarship

The present study also contributes to the emerging literature on IDY itself. Existing scholarship has tended to focus on three primary themes: health promotion, cultural diplomacy, and political interpretation. Much of this work is either explicitly promotional, documenting the benefits of yoga and public participation, or descriptive, reporting events and institutional activities associated with IDY. A smaller body of scholarship has investigated IDY’s role in promoting ethno-nationalism through magnifying the soft power instrumentalization of its political symbolism. Still, relatively little research has treated IDY as an empirical object of discourse analysis. Instead, the predominant emphasis has been on evaluating the initiative’s health outcomes, diplomatic significance, or ideological implications rather than investigating the communicative structures through which those meanings are produced and circulated.

This is partly why the present study has adopted the approach of avoiding asking whether IDY is beneficial, effective, or politically desirable. Instead, it examines how discourse surrounding IDY is organized and how that organization changes over time. Thus, by combining corpus construction, unsupervised clustering, longitudinal analysis, and statistical modelling, this present study has purposely shifted attention away from normative evaluation to empirical investigation. It is important to make this distinction because it allows IDY to be analyzed as a communicative ecosystem in its own right. Thus, from this perspective, questions concerning health promotion, nationalism, cultural diplomacy, or public participation become observable components of a broader discursive field rather than predetermined explanatory frameworks. Adopting such an approach opens up new possibilities for the study of, not only IDY but, contemporary cultural initiatives, public rituals, and globally mediated commemorative events. At broader level, the findings demonstrate the value of computational approaches for investigating large-scale cultural phenomena. By analysing discourse longitudinally and at scale, researchers can move beyond isolated case studies, anecdote and opinion to examine the processes through which institutional narratives emerge, stabilize, and transform over time. In this respect, IDY provides a useful case study of how cultural, political, and health-related discourses become institutionalized within contemporary digital media environments.

8 Limitations

Several limitations should be acknowledged when interpreting the findings of this study.

First, due to the extraction limitations, the corpus exhibits uneven temporal coverage across the study period. Despite the final dataset spanning 2014–2026, the number of harvested transcripts varies considerably between years. This is perhaps somewhat due to the earlier years of the corpus containing relatively fewer documents, while later years are represented by substantially larger samples. This imbalance reflects both the historical development of IDY itself and the availability of digital media content. Consequently, yearly comparisons should be interpreted cautiously, particularly for years with limited observations.

Second, the corpus is platform-dependent. The dataset was constructed primarily from YouTube transcripts, creating a specific digitally mediated environment. While YouTube provides broad coverage of IDY-related activities, it does not capture the entirety of the communicative field. Important forms of discourse circulating through television broadcasts, print media, governmental documents, other social media platforms, organizational reports, and offline events remain outside the scope of the present analysis. Even though they have, to various degrees, been consulted. The corpus should therefore be understood as a substantial but necessarily partial representation of IDY discourse. For example, a great deal of data has been harvested from both Twitter and Instagram.

However, the decision was made to focus this paper on YouTube.

Third, the dataset exhibits a degree of linguistic bias. Although efforts were made to include multilingual material where available, the final corpus is disproportionately composed of English-language transcripts due to the greater availability and accessibility of English subtitles and transcripts on the platform. One of the biggest issues related to the scraping of transcripts was choosing which languages to include. The issue of collecting all available languages meant collecting machine translated versions, or triggering 429 issues through sending too many requests. As a result, the findings may underrepresent communicative practices occurring in Hindi and other regional languages, as well as forms of discourse intended primarily for local rather than international audiences.

Fourth, the DSI developed in this study is designed to capture structural variation within discourse rather than semantic meaning in a narrow sense. This is why there is virtually no discourse presented in this paper. Following the semantic waves is a different topic for a future paper. Instead, the index identifies patterns of differentiation, organization, and positioning among discourse communities, avoiding directly measuring ideological content, sentiment, persuasion, or political orientation. Consequently, the DSI values should be interpreted as indicators of discursive structure rather than as direct measures of substantive meaning.

Fifth, the study relies upon automated transcript extraction and computational text-processing procedures. Although extensive cleaning, validation, and quality-control measures were implemented throughout corpus construction, transcript-based research inevitably contains levels of noise. These arise from subtitle errors, transcription inaccuracies, metadata inconsistencies, and platform-specific artefacts. Even though significant attention was paid to limiting these factors, it is hoped that they will be unlikely to alter the overall patterns identified in the analysis. Still, there may be an influence upon individual documents and local cluster assignments.

Finally, the clustering procedures employed in this study are just one way to represent possible interpretation of the latent structure of the corpus. There are other ways to potentially approach this analytical frame and topic through adopting alternative embedding models, clustering algorithms, preprocessing strategies, or parameter selections. Obviously, different approaches may produce somewhat different cluster boundaries, which would alter the results. Nonetheless, the objective of the analysis has not been to identify a single definitive classification of IDY discourse. Instead, it has attempted to reveal robust patterns of differentiation and temporal development within a large and heterogeneous corpus.

Despite these limitations, the consistency of the observed temporal trends across multiple statistical procedures, including analysis of variance, regression modelling, and mixed-effects models, suggests that the principal findings are unlikely to be artefacts of a particular methodological choice. Therefore, it would be interesting to reframe this same corpus with modulated analytical metrics to see what results might emerge.

9 Conclusion

This study presents a longitudinal computational critique of the International Day of Yoga (IDY) corpus from its inception through 2026, mapping its structural transition from a global wellness event into a complex discursive field. Utilizing an integrated mixed-methods linguistic framework across 509 localized transcripts and 1,758 multi-tiered policy artifacts, the empirical results challenge prevailing normative, uncritical, or purely promotional views of the annual observance. Rather than broadcasting a singular, coherent message of cosmic, spiritual, or physical harmony, the IDY communicative ecosystem is structurally defined by sharp institutional partitioning, persistent

sub-community divisions, and highly uneven temporal trajectories.

Our longitudinal modeling confirms that while the Indian state has systematically retooled civilizational and yogic statecraft to serve macro-level environmental governance frameworks, this top-down diplomatic signal undergoes significant diffraction when filtered through international media, educational, and commercial wellness networks. This structural divergence demonstrates that discursive institutionalization does not inherently result in ideological homogenization. Instead, the IDY field proceeds through structured fragmentation, allowing state-aligned channels (such as Cluster 4 and Cluster 6) to aggressively build complex policy narratives over time, while grassroots networks (such as Cluster 2) remain statically anchored to basic wellness tenets.

Ultimately, the long-term viability and diplomatic durability of the IDY may rest precisely upon this plastic structural flexibility—its unique capacity to accommodate radically competing agendas simultaneously without collapsing under a forced uniformity. Methodologically, this investigation illustrates the robust utility of computational sociology to move beyond descriptive word-frequency counts or arbitrary classification schemas. By testing explicit inferential hypotheses longitudinally and at scale, researchers can directly model the processual dynamics through which state-driven cultural initiatives, public rituals, and globally mediated commemorative events become stabilized, defracted, and transformed within digital media environments.

Declaration

No funding was received to assist with the preparation of this manuscript. The authors have no relevant financial or non-financial interests to disclose.
